Learning Garden Activity Guide

ACKNOWLEDGEMENTS

The Learning Garden Activity Guide is an educational guide for teachers. This guide is designed for students from Kindergarten to Grade 8. The developers would like to thank Nutrients For Life for partnering on the project and the PEI Department of Agriculture and Vesey's Seeds for their generous contributions.

TO THE TEACHER

Thank you for using the Learning Garden Activity Guide. This guide has been designed for students attending Prince Edward Island schools by using the light garden to grow different vegetation. Grade's activity is designed to meet specific curriculum outcomes designated by the Prince Edward Island Department of Education curriculum guides. We appreciate any feedback that you would like to share. If you have any stories, student writing pieces or artwork that you would like to share please do so. This helps support our project and showcase the great things happening in PEI Schools

YOUR LIGHT GARDEN PACKAGE INCLUDES:

- 1. Two Tier Light Garden (with black shelf trays)
- 2. USB Stick(with Agriculture resources to use in the classroom) or Light Garden Binder
- 3. Soil(s) for Light Garden
- 4. Seeding Trays and/or Pots
- 5. Water Soluble/Granular Fertilizer (depending on grade)
- 6. Seeds for the lesson
- 7. Timer and Electric Outlet
- 8. Permission Form
- 9. Light Garden Contract

Things to Return after the Program:

- 1. Two Tier Light Garden (with black shelf trays)
- 2. Binder with the Light Garden Guide (if given)
- 3. Timer and Electric Outlet
- 4. Teacher Evaluation
- 5. Permission Form signed
- 6. Light Garden Contract

Each activity has the following format:

- 1. **Objective:** States the goals of the activity
- 2. Curriculum Fit: Shows a list of all the specific subject curriculum outcomes that could be met
- 3. Materials: Shows a list of materials needed to complete the activity
- 4. **Background Information:** Provides some useful knowledge of why the activity is important, or how it could be applied to the real world
- 5. Introduction: Some topics that should be discussed prior to starting the experiment or activity
- 6. Activity/Procedure: Step by step on how to perform the experiment
- 7. Conclusion: What could be learned by completing the experiment and activities
- 8. In-Class Discussion: A list of topics to discuss after the activity has been completed
- 9. Activity Log: A list of all the activities to be completed for each grade level

This guide is designed to be a fun, interactive, and educational activity that teachers and students will enjoy. Some students will even be fortunate enough to take home their plants and grow them at home!

General Science Curriculum Outcomes:

- 1. Students will develop an understanding of the nature of science and technology, of the relationships between science and technology, and of the social and environmental contexts of science and technology.
- 2. Students will develop the skills required for scientific and technological inquiry, for solving problems, for communicating scientific ideas and results, for working collaboratively, and for making informed decisions
- 3. Students will construct knowledge and understandings of concepts in life science, physical science, and earth and space science, and apply these understandings to interpret, integrate, and extend their knowledge
- 4. Students will be encouraged to develop attitudes that support the responsible acquisition and application of scientific and technological knowledge to the mutual benefit of self, society, and the environment

Growing Under Full-Spectrum Fluorescent Bulbs

With the advancement of today's technology, growing vegetation indoors has never had so many exciting options. One of the most exciting advancements has been with the full spectrum fluorescent bulbs. These fluorescent bulbs replicate many of the conditions offered by the sun including the temperature of the light in the bulb. The amount of replication of natural sunlight is higher than most normal bulbs. This allows the light from the bulbs to mimic natural conditions, and then the plants receive all their required light colors. The system is also more environmentally friendly than using shop lights, because the system lights are brighter, while also using less energy.

The height of the light fixtures is also adjustable. As the plants grow, the height of the lights can be raised to avoid burning the plants, and to ensure as much of the plant as possible receives light. The average height distance to be used in this experiment is 7.5cm (3 inches) above the tallest plant unless otherwise stated. If the top plant feels warm from the lights, a bigger separation will be needed.

The lights on the system need to be wiped clean on a monthly basis. As well, lights should be wiped prior to beginning the activity, and at the conclusion of the activity. Any dirt and dust build up would reduce the amount of light that reaches the plants.

Plants should have their position on the light garden tray rotated on a weekly basis. The reason for this is that the intensity of the bulb is higher in the center than at the ends. If plants are not rotated, the experimental results will likely be biased towards the center plants.

The lights should be used daily from whenever the teacher arrives in the classroom until the teacher leaves. This should provide each plant with at least 7 hours of light a day. Lights must be shut off as plants do require a break period from the light or development will suffer.

Care for the Indoor Light Garden

How to turn on:

- 1. Ensure the rows that are being used are plugged in.
- 2. Each power cord has a rotating wheel, surrounded by a black box, on it. Turn the wheel to turn the lights on or off, do this for both rows of the garden.
- 3. Both rows of lights should have illuminated. In the case where only one row lit up, check the link between the lights. The link is found in the same position where the power cord plugs into the lights, however on the other end of the lights.

How to raise the light height:

- 1. Go to the side of the light garden.
- 2. Each row has a metal chain with a ring on the end. Grab the ring.
- 3. Pull chain horizontally with the ground. This will pull up the side closest to you.
- 4. A chain grip is found on the metal chain. Push the chain grip up until it is touching the frame of the machine. This will hold the chain, and light row, in place.
- 5. Repeat procedure to adjust the other side of the indoor light garden.

How to lower the light height:

- 1. Go to the side of the light garden.
- 2. Grab the metal ring. Hold firmly so the row does not slip.
- 3. Open the chain grip by pushing on its side. Slowly allow the chain to slide through the chain grip.
- 4. This should lower one side of the light fixture. When a desirable height is found, let go of the chain grip. Do not let go of the chain until you are certain the grip is holding the chain securely.
- 5. The procedure should be repeated with the other side of the light row.

Cleaning:

Lights:

- 1. The lights should be cleaned at least once a month. This is to prevent dirt and dust from building up.
- 2. To clean the lights, unplug all cords for the unit.
- 3. Find a soft, dry cloth. Rub lights with the cloth to clean.

Frame:

- 1. The hoods and frame should be cleaned regularly as well.
- 2. Unplug all cords for the unit.
- 3. Gently wipe with a damp cloth.

Growing Trays:

- 1. Each row on the light garden should hold two 37cm x 24 cm growing trays.
- 2. If one tray wears down, please use one of the replacement trays in its place.

Care for the Plants

Watering

- 1. Plants should be watered as specified in the procedure.
- 2. Water should be fed directly onto the soil, avoid "showering" the plant as this could cause disease.
- 3. Plants should be watered early in the morning.
- 4. Do not overwater the plants! This could be as bad as not watering the plants enough. (Sometimes if you over water a white mildew will form on the soil)

Lights

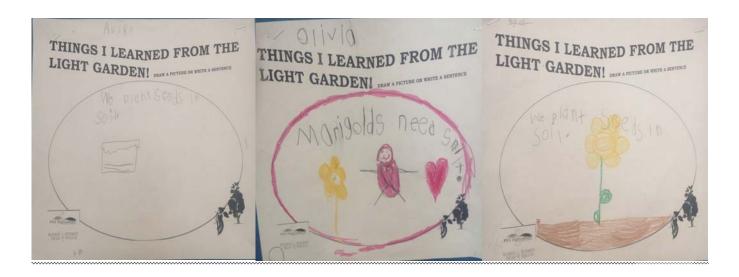

- 1. Lights should be turned on daily (if no timer is present).
- 2. Remember to rotate the positions of the plants on the light garden tray. All plants need equal amounts of light to avoid an experimental bias.
- 3. Lights also need to be turned off regularly as too much light can kill plants. An ideal amount of light to receive, at most, would be between 6-8 hours daily.

Fertilizer

- 1. In a watering jug, add one package of fertilizer (1 package will make enough for 8L of water)
- 2. Mix the fertilizer and water well.
- 3. Apply fertilizer mixture to the plants (fertilize on a weekly basis)
- 4. Mixture should be added to the soil. Do not pour mixture onto the leaves of the plant.
- 5. Wash hands immediately after using fertilizer.

Planting Depth of Seeds

Type of Seed	Planting Depth
Bean	3-4 cm
Cucumber	3 cm
Lettuce	0.6 cm
Marigold	0.6 cm

SOME ART WORK FROM MRS. CREELMAN'S CLASS, ATHENA CONSOLIDATED, SUMMERSIDE, 2016

KINDERGARTEN ACTIVITY

Exploring the Five Senses with Plants

Objective: To apply the five senses as a method to describe plants.

Curriculum Fit:

Science: Exploring the World Using Our Senses

1.1 - Become aware of our five senses

1.2 - Develop and use vocabulary associated with the five senses

Social Studies: I am Unique

1.3 - Demonstrate that cooperation is an important part of being a member of a group

Health and Physical Development:

Personal Development

3.3 - Engage in and complete activities independently; and seek assistance as necessary

Materials:

- Indoor light garden
- Growing trays
- Fertilizer
- Potting soil
- Cucumber seeds
- Tomato seeds
- Marigold seeds
- Lettuce seeds
- Additional supplies that are needed but not supplied by program- watering can, popsicle sticks to mark students plants

Background Information:

The five human senses are taste, smell, sight, touch and hearing. Each of these five senses serves a different purpose. In humans, taste occurs in the mouth. It is a result of interaction between the material and taste buds found in the mouth. The taste buds send a message to the brain, which creates the sensation of taste. Smell allows a person to detect any aromas in the air. Sight is the ability to see. Sight serves many purposes including: determining how far away an object is, reading, and watching television. Touch is the ability to feel where an object is by having physical contact with that object. The last sense is hearing. Hearing is the ability to recognize a particular sound. As well, the persons should recognize where that particular sound came from.

Picture taken from http://www.clipartkid.com/senses-clipart-clipart-panda-free-clipart-images-MbWY3O-clipart/

Introduction:

Briefly explain to students the following:

- 1. What the five senses are.
- 2. What each of the five senses mean.

Activities/Procedures:

- 1. Each student will be assigned to one of three plants; marigolds, cucumbers, or tomatoes.
- 2. Each seed should be planted to an appropriate depth, and each tray labeled so it is known which plant is in which tray.
- 3. The planted seeds should be transferred to the light garden for the experiment.
- 4. Plants should receive light on a daily basis.
- 5. Marigolds should be watered every second day, or every day if the soil is dry. Tomatoes should be watered twice a week; once at the start, and once at the end (Monday/Thursday or Tuesday/Friday would be the two best combinations). Cucumbers should be watered enough to ensure that the soil is constantly damp, however not completely soaked. Use the water soluble fertilizer weekly with regular watering.
- 6. The first day of each school week, the plant tray's positions should be rotated to ensure all plants receive equal light intensity. As well, the rows should be checked to see if the height of the light fixtures needs to be adjusted.
- 7. The activities in the Activity Log should be completed at the end of the experiment.

Conclusion: The student should have a stronger understanding of the five senses, and be able to apply these senses to describe objects.

In-Class Discussion:

- 1. In what other situations would each of the senses be important?
- 2. Are any of the senses more important than others or are they all equal?

Kindergarten Activit	v Log:	Exploring the	Five	Senses	with	Plants

Please Note: If writing skills are not yet developed, the questions in the Activity Log are allowed to be done as part of the in-class discussion.

Sense of Touch:

Feel the different parts of a plant including roots, stem, and leaves. How do the different parts feel? Are they soft, hard, smooth, bumpy, etc.

Repeat the same exercise with two different types of plants. After feeling the third plant, students should be able to notice at least one major difference between each plant through touch.

Sense of Sight:

Look at each of the plants. Describe some of the major features of each of the plants including, but not limited to, the color, size, and height.

Sense of Smell:

Get students to smell each of their plants. Do any of the plants have a noticeable or unique odor? Do some of the plants have no odor at all?

Sense of Hearing:

One of the most noticeable sounds made by plants is the rustling of their leaves in the wind. Listen to the sound difference between the plants when they are inside with no wind, to outside when there is wind present.

Sense of Taste:

(how did the lettuce taste?)

The sense of taste has many important functions for humans. The main sensations are sweet, salty, bitter, and sour. Can you think of any fruits or vegetables that would fall under these categories?

<u>Kindergarten Activity Log Answer Key:</u> Exploring the Five Senses with Plants

All questions are opinion based. It is at the discretion of the teacher to decide what an acceptable answer is.

Grade 1 Activity

The Structures of a Flower

Objective:

At the end of the plant's growth period, students should be able to label the different parts of a plant, and know the observed difference between a flowering and non-flowering plant. Students should be able to measure and record information about a plant.

Curriculum Fit:

Science: Characteristics of Living Things:

201-5 – Make and record relevant observations and measurements about animals and plants, using written language, pictures, and charts.

203-5 - Identify and use common terms for parts of humans, other animals, and plants

100-8 – Identify and describe common characteristics of humans, other animals, and plants, and identify variations that make each person, animal, and plant unique

203-4 - Listen and respond to another student's description of an animal or plant

202-2 - Place animals and plants in groups according to one or more characteristics

100-5 – Describe different ways that plants and animals meet their needs

103-2 – Recognize that humans and other living things depend on their environment, and identify personal actions that can contribute to a healthy environment

200-3 - Make predictions about seasonal changes in plants and animals

Materials:

- Indoor light garden
- Growing trays
- Water
- Fertilizer
- Potting soil
- Paper
- Marigold seeds
- Lettuce seeds
- Additional supplies that are needed but not supplied by program- watering can, popsicle sticks to mark students plants

Background Information:

Agriculture is very important in today's world. Providing healthy food choices for individuals and supplying major companies with raw products for manufacturing. One major field of agriculture is growing plants. Plants supply humans with many of the nutrients and minerals required to live a healthy life. Most plants are generally composed of three main parts: the roots, the stem, and the leaves. The roots anchor the plant in the ground and absorb water and minerals (food). The stem can be thought of as a transport zone between the roots and the leaves. The leaves are where the water is expelled and sunlight is absorbed.

Introduction:

Explain to students the following before starting the experiment:

- 1. How to use the chart in the Activity Log.
- 2. Things a plant needs to grow and survive.
- 3. The major structures of a plant.

Activity/Procedure:

- 1. Each student in the classroom is to be assigned one seed from either a flowering or a non-flowering plant. Ensure that there is an equal number of flowering and non-flowering plants distributed.
- 2. The student will be assigned a specific tray cell for the indoor light garden and must fill it with soil.
- 3. The student must bury the seed an appropriate depth to ensure growth will occur. Students should not remove the seed from the garden until the end of the experiment.
- 8. Plants should receive light on a daily basis. Lettuce should be watered daily as a seed. Once lettuce has germinated (is visible above the soil surface), lettuce only has to be watered enough to ensure the soil is kept damp. Marigolds should be watered every second day, or every day if the soil is dry. Use the water soluble fertilizer weekly with regular watering.
- 4. Each student should record the height of their plant, in the activity log, every Monday, Wednesday, and Friday. If a plant is not visible above the soil, a height of 0.0cm should be recorded. The measurement should be from the soil level to the highest point on the plant.
- 5. At the start of every week, the plant tray positions should be rotated to ensure that all plants receive equal amounts of light. As well, the rows should be checked to see if the height of the light fixtures needs to be adjusted.
- 6. At the conclusion of the allotted growth time frame, the Activity Log attached to the section must be completed.

Conclusion:

Students should be able to see the observed differences between flowering and non-flowering plants. Students should also have learned some of the different parts of a plant and how to make and record measurements of a plant.

In-Class Discussion:

- 1. Discuss some of the advantages of using an indoor growing system. How would this affect the seasonal growth of some plants?
- 2. What are some ways that plants meet their physical needs?
- 3. Humans have a heavy dependence on their environment. What are some ways that humans could contribute to a healthy environment?

Picture 1: Lettuce and Marigolds from Mrs. McAleer, Glen Stewart Primary, Stratford, 2016

Grade 1 Activity Log: The Structures of a Flower

Please Note: If writing skills are not yet developed, the questions in the activity log are allowed to be done as part of the in-class discussion.

Create a chart showing the height of each plant every Monday, Wednesday, and Friday. A height of 0.0cm should be recorded if no plant is visible.

Date	Plant Height (cm)	Date	Plant Height (cm)

Did you have a flowering or non flowering plant?	
What do plants need to survive?	

Dig your plant out of the soil pot. Press the plant with a light book against the paper. Either pin the plant (if possible) to the paper, or trace the outline of the plant on the paper. Correctly label the roots, stem, and leaves of the plant on the paper.

Compare your plant with a fellow classmate. Make sure both students have different plants. Each student should give a quick description of their own plant to their classmate. Compare the two plants, while making a list of multiple similarities and differences.

Similarities	Differences
1.	1.
2.	2.
3.	3.
4.	4.
5.	5.

Grade 1 Activity Log Answer Key: The Structures of a Flower

Did you have a flowering or non flowering plant?

This depends on which type of seed was assigned.

What do plants need to survive?

A large list could be made including water, sunlight, air, soil, fertilizer, etc.

Dig your plant out of the soil pot. Press the plant with a light book against the paper. Either pin the plant (if possible) to the paper, or trace the outline of the plant on the paper. Correctly label the roots, stem, and leaves of the plant on the paper.

Roots are the portion of the plant that is found mostly below ground, the stem is the long middle portion, and leaves grow out of the stem.

Compare your plant with a fellow classmate. Make sure both students have different plants. Each student should give a quick description of their own plant to their classmate. Compare the two plants, while making a list of multiple similarities and differences.

A large list could be made. Some major differences include height, number of leaves, flowers, color, root system, etc.

Grade 2 Activity

The Stages of Plant Development

Objective:

Students will have a chance to grow their own plants. At the end of the growth period, students should be able to observe and describe the changes in the plant and be able to recognize when these changes occur.

Curriculum Fit:

Science:

Investigating the Needs and Life Style of an Organism

- 101-7 Observe and describe changes in the appearance and activity of an organism as it goes through its life cycle
- 201-5 Record relevant observations of changes in the appearance and activity of an organism as it goes through its life cycle, using written language, pictures, and/or charts
- 102-6 Identify constant and changing traits in organisms as they grow and develop
- 203-5 Respond to other students' ideas about an organism's needs and changes in growth pattern
- 203-2 Recognize the stages of development of the organism, using applicable terminology and language
- 202-7 Propose suggestions for meeting the needs of the organism being investigated, and draw conclusions about its growth patterns or stages based on observations
- 203-3 Communicate procedures and results of the investigation into the life cycle of an organism, using drawings, demonstrations, and/or written and oral descriptions

Mathematics: Shape and Space

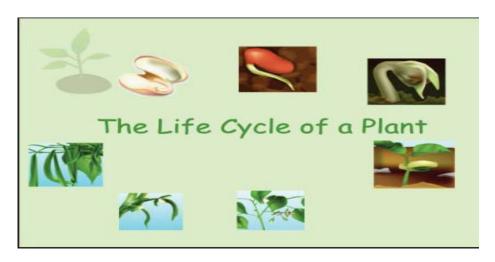

SS3 – Compare and order objects by length, height, distance around and mass (weight) using nonstandard units, and make statements of comparison

Materials Needed:

- Indoor light garden
- Growing trays
- Water
- Fertilizer
- Potting soil
- Bean seeds
- Lettuce seeds
- Additional supplies that are needed but not supplied by program- watering can, popsicle sticks to mark students plant tray cell

Background Information:

The ability to record, describe, and understand change are very important skills to have. In the experiment to be performed, each student should grow one bean plant, and be able to observe and describe change in a plant's life cycle, and understand at what stage in development these changes occur. A plant is a great way to model the lifecycle of an organism. A plant follows a similar growth pattern to most animals. The major stages of growth in a bean plant in order are emergence and early growth, branching and rapid growth, flowering and pod formation, and pod fill and maturation (information was taken from http://www.colostate.edu/Orgs/Vegnet/vegnet/dbgs.html)

Taken from: scoilmhuirejunior.ie

Bean Plant Lifecycle

Introduction:

The teacher should explain the following to students prior to starting the experiment:

- 1. How to use the recording chart in the Activity Log.
- 2. Briefly go over the different stages of development of the organism (seed, germination, seedling, full plant).

Activity/Procedure:

- 1. Students should each receive one seed. .
- 2. Each seed should be buried in soil to an appropriate depth.
- 3. Students should place their trays containing seeds on one of the light garden rows prior to experiment.
- 4. Once seeds are planted, they should be transferred to the light garden. Plants should receive light on a daily basis. As well, beans should be water at least every second day. Ensure that the soil is damp, but not soaked, after being watered. Use the water soluble fertilizer weekly with regular watering.
- 5. Measurements of plant height and recording of observed changes will be taken on Monday, Wednesday, and Friday. A height of 0.0cm should be recorded if no plant is visible. The measurement should occur from the soil to the highest point on the plant.
- 6. At the start of every week, the plant trays must be rotated as this will ensure that all plants receive an equal amount of light. As well, each row should be checked to see if the height of their fixtures needs to be adjusted.
- 7. Students should complete the activities in the Activity Log once the activity has finished. The Activity Log starts on the next page.

Conclusion:

Students should have been able to observe, describe, and record changes in the plant throughout its lifecycle. Students should also be able to say at what stage in the plant's lifecycle certain changes occurred.

In-Class Discussion:

- 1. How are the life stages of a plant similar to that of a human?
- 2. Were changes immediate (ie occur overnight) or were many of the changes gradual?

Grade 2 Activity Log: The Stages of Plant Development

Create a chart showing the height of each plant every Monday, Wednesday, and Friday. A height of 0.0cm should be recorded if no plant is visible.

Date	Height (cm)	Observed Changes	_
			_

Grade 2 Activity Log Answer Key: The Stages of Plant Development

What major changes does a plant experience throughout its life cycle?

Seed grows roots and a stem. Stem can grow leaves or flower. Size and potentially color changes as well.

What features of plants were consistent (not changing) over an extended period of time?

Refer to experiment results that students found.

During periods of rapid and small growth, did the basic needs of the organism appear to change (eg did the soil appear dryer indicating higher water uptake)? What do these changes indicate?

Again, this is a question that students answer based on their results. A logical answer should support what those changes indicate.

Compare your findings with those of fellow students. Did they have any ideas that differed from yours? What were they?

This answer will vary depending on what students had thought of.

Knowledge:

What are some basic needs of most plants?

A large list could be made including water, sunlight, air, soil, fertilizer, etc.

Could you divide the life cycle of a plant into any distinct stages? What are these stages called?

The life cycle could be divided into seed, seedling, plant, and flower.

Grade 3 Activity

Testing Growing Conditions for Plants

Objective:

To determine what conditions are best for growing certain types of plants. Students will also learn about the importance of plants to the environment and animals.

Curriculum Fit:

Science:

Investigating Germination and Growing Conditions for Plants

- 202-2 Place seeds in groups according to one or more attributes
- 200-1 Ask questions to investigate related to growing conditions for plants
- 200-3 Make predictions about which conditions will be best for plant growth
- 201-5 Make and record relevant observations and measurements of plant growth during their investigation
- 202-4 Construct and label bar graphs that show plant growth under different conditions
- 100-29 Draw inferences that identify and investigate life needs of plants and describe how plants are affected by the conditions in which they grow
- 100-29/203-2 Identify and describe parts of plants and their general function
- 202-5 Identify and suggest explanations for patterns and discrepancies in the growth rate of similar plants grown in varying conditions

The Life Cycle of a Plant

- 201-6 Estimate measurements of the plant as it grows
- 100-30/201-5 Observe and describe changes, using written language, pictures, and charts, that occur through the life cycle of a flowering plant

Uses for Plants

- 102-12 Describe ways in which plants are important to living things and the environment
- 102-13 Identify parts of different plants that provide humans with useful products, and describe the preparation that is required to obtain these products and how our supply of useful plant is replenished
- 203-5 Respond to the ideas and actions of others and acknowledge their ideas about the uses and replenishing of plants

Interactions of Living Things and Soils

100-35 - Investigate and describe how living things affect and are affected by soils

Materials Needed:

- Indoor light garden
- Growing trays
- Water
- Potting soil
- Paper
- Bean seeds
- Marigold seeds
- Lettuce seeds
- Fertilizer

- Additional supplies that are needed but not supplied by program- watering can, popsicle sticks to mark students plants

Background Information:

Plants are essential for the survival, of not only humans, but every animal on the planet. Plants are usually at the bottom of most food chains. Plants also provide many of the essential nutrients required in a healthy diet. Growing plants can be very dependent on the conditions in which they live. The amount of sunlight and water received are two of the most important conditions. In the experiment to be performed, optimum light levels are to be researched. One row of the Light Garden will be watered (soil to be kept moist but not wet) and have the lights turned on daily Monday-Friday. The second row, will be watered (soil to be kept moist but not wet), however only have its lights turned on Monday and Friday only. By controlling the light variable, the importance of light will allow the students to observe how light can affect its growth.

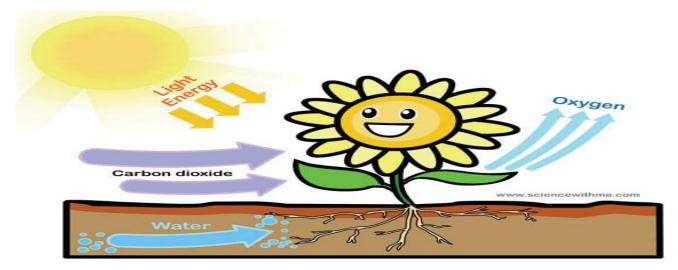

Photo taken from http://sciencewithme.com

Introduction:

Explain to the students the following before the experiment

- 1. What condition each row of the Light Garden will represent.
- 2. On what days to have the lights on for each row.
- 3. If multiple seed types are being used, ensure that each plant type has a unique bar graph.

Activity/Procedure

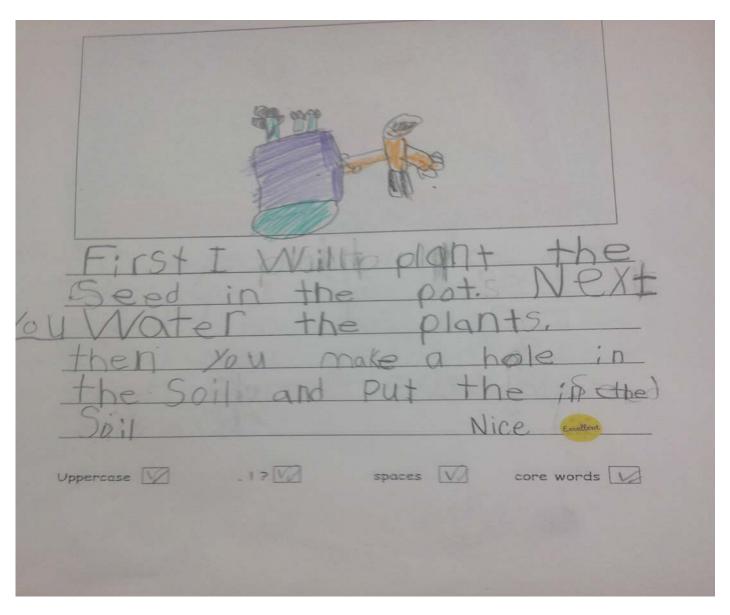

- 1. Students will be divided into groups of two
- 2. Each student in the group will pick up one seed.
- 3. Label the rows as follows:
 - i. TOP ROW-water as needed, lights on daily
 - ii. BOTTOM ROW: water as needed, lights on Monday and Friday only
- 4. Each group member is to bury their seed in a different environment than their partners. Ensure that seeds are buried to an appropriate depth. Use water soluble fertilizer weekly with regular watering.
- 5. Students should read the Activity Log to complete any pre-experiment activities. The Activity Log is found after the in-class discussion.
- 6. Plants need to be measured on a regular basis. All height measurements will be taken on Monday, Wednesday, and Friday. A height of 0.0cm indicates that the plant is not yet visible. The measurement should be taken from soil level, to the top of the plant.
- 7. At the start of every week, the plant trays should be rotated. This is to ensure that all plants receive an equal amount of light for growth. As well, each row should be checked to see if the height of each light fixture needs to be adjusted.
- 8. Once the final day of the experimental period has occurred, one final measurement should be taken for the heights and be recorded.
- 9. All remaining activities in the activity log should be completed.

Conclusion:

Students should be able to report which light conditions were best for each plant. These results can be through displaying the data in a bar graph. Students should also have a basic understanding of the importance of plants to the environment and towards humans.

In-Class Discussion:

- 1. What are some ways that plants could be replenished?
- 2. Ignoring height as the only factor, what was the quality of each plant that was grown? Were some plants shorter but appeared healthier?

Writing piece from Mrs. Cameron's Class, West Royalty, Charlottetown, 2016

Grade 3 Activity Log Answer Key: Testing Growing Conditions for Plants

Complete Before Growing:

Compare the different types of seeds being used. What is similar in the seeds? What is different?

This is an opinion question, but some examples of what could be compared include color, texture, size, and depth of planting.

Knowing the conditions the plants will be grown in, make a prediction on what will happen to the plants under each condition.

This is an opinion based question so most answers should be acceptable

Complete After the Experiment:

Construct a bar graph showing the average height of all plants (the same type as yours) in your class. Only use the final height of each plant during the calculation of the average height. Using these results, identify the needs of plants, and identify how conditions affect these needs.

Students should create the bar graph. The bar graph should show a difference in plant height, and students should be able to predict which set of conditions was best for plant growth.

If a fourth row had been available that only received water and light on Monday, Wednesday, and Friday, how well would the different plants have grown? Use the results from your experiment to answer the question.

Students should be able to see how less sunlight and water affect plant growth by looking at their bar graphs. Students should be able to make a prediction about how a lack of both sunlight and water would affect plant growth.

There are many different parts on plants. Identify some of the parts on your plant and describe the function of that part.

Many different parts could be chosen. Only focus on the ones students have learned in class.

Importance of Plants:

How are plants important to living things and to the environment in general?

Multiple answers are acceptable including creating oxygen, providing food, protection, ect

Plants are essential for human health. What parts of plants are important for humans?

All parts from plants can be useful depending on what plant they come from. For example, the root of carrots, stems of celery, and the leaves of lettuce can all be eaten.

Compare your answers with those of a fellow classmate for the last two questions. Did you have any different ideas or different results that occurred during the experiment? If so, what were the differences?

The answers for this question depend on how the students answered the previous questions.

Grade 4 Activity

Adaptive Structures of Plants

Objective:

To observe the structural features that allow plants to survive in a variety of different conditions and to understand which conditions are best for growth of certain plants.

Curriculum Fit:

Science: Habitats and Populations

204-1 – Identify questions to investigate about the types of plants and/or animals at a local habitat, and the conditions under which they live

206-2 – Compile and display the data collected in the habitat study using tallies, tables, and/or bar graphs 205-5/302-1 – Make observations and collect information related to local habitats and their associated population of plants and animals

104-4/206-3 – Present the procedures and results of their habitat studies, compare their results with those of other class members, recognizing that results may vary, and suggest reasons for these discrepancies

Structural Features of Plants that Enable Them to Survive in Their Habitat

302-2/104-6 – Using appropriate terminology compare the structural features of plants that enable them to survive in different kinds of places

106-4 – Describe how scientists knowledge of plant growth has led to agricultural innovations and techniques

105-1 - Describe current investigations into local or regional habitat issues

Sources of Light

107-4 – Provide examples of how human-made sources of light have been designed to solve problems in the home and at school

108-1 - Identify positive and negative effects of exposure to light

Mathematics Patterns and Relations

PR3 – Represent and describe patterns and relationships using charts and tables to solve problems

Materials Needed:

- Indoor light garden
- Growing trays
- Water
- Fertilizer
- Potting soil
- Vermiculite
- Bean seeds
- Marigold seed
- Lettuce seeds
- Additional supplies that are needed but not supplied by program- watering can, popsicle sticks to mark students plants

Background Information:

Different structural adaptations have enabled plants to survive in a number of different types of environments. Adaptations include the leaf of a cactus, the fibrous root system of the marigold, the taproot of the carrot, and bright colors to attract pollinators. In the experiment to be performed, different adaptations will be tested to see what adaptations are good for different environments. The experiment in question will test the plants ability to grow in a variety of different soils.

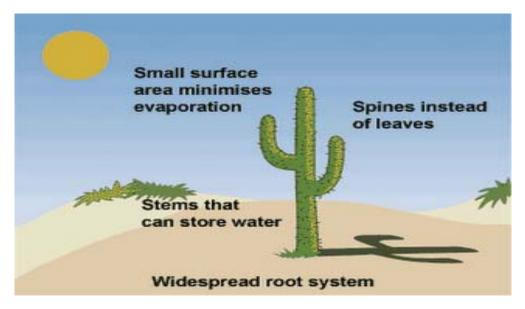

Photo from http://parfshotclimates.blogspot.ca

Introduction:

Explain to students the following:

- 1. Different forms of adaptation plants use for different environments.
- 2. The nutritional value of the different soils.
- 3. Explain what kinds of vegetation regularly live in these habitats (where the soil types are found).

Activity/Procedure:

- 1. Assign students into group of four.
- 2. Each group should receive four seeds: two of each type of plant being used.
- 3. Two different types of soil should be used to grow the plants in. Fill two trays with one type of soil and fill two other trays with the other type (vermiculite).
- 4. The class should now have four different trays. Each tray represents a different seed/soil combination. Be sure to label the seed/soil combination on the side of the tray. Use water soluble fertilizer weekly with regular watering.
- 5. Each group should plant the appropriate seed in the appropriate tray. Be sure to label which slot in each tray belongs to who for identification purposes when switching the garden.
- 6. All trays should then be transferred to the light garden.
- 7. Lighting should take place every school day. Beans should be watered at least every second day. Ensure that the soil is damp, but not soaked, after being watered. Marigolds should be watered every second day, or every day if the soil is dry.
- 8. Plant height should be recorded every Monday, Wednesday, and Friday in the activity log. If a plant is not yet visible, a height of 0.0cm should be recorded. Plants should be measured from the soil to the highest point of the plant. During the weeks the plants are located with students in the 4th grade, the numbers for those weeks can be taken from the 4th grade students.
- 9. At the start of each week, the position of the trays should be rotated. This is to ensure all plants receive a relatively equal amount of sunlight. As well, each row should be checked to see if the height of the light fixtures needs to be adjusted.
- 10. At the end of the activity, plants should be examined. Height, quality of the plants (green or yellow in color), and if applicable, flowers are examples of what should be examined.
- 11. Activities in the Activity Log should then be completed.

Conclusion:

Students should have witnessed the growth (or non growth) of plants under different conditions. Students should be able to guess what features of certain plants allow for the adaptation to certain environments.

In-Class Discussion:

- 1. The classroom should discuss which plants were able to survive in different conditions. Students should also be able to explain why certain plants were able to survive in these conditions while others were not able to.
- 2. Can students think of any new adaptations that were not mentioned during the introduction?
- 3. What are some advantages and disadvantages to using human made light as compared to using sunlight?

Grade 4 Activity Log: Adaptive Structures of Plants

Create a chart showing the height of each plant every Monday, Wednesday, and Friday. A height of 0.0cm should be recorded if no plant is visible.

Date	Bean Height in Potting Soil (cm)	Bean Height in Vermiculite (cm)	Marigold Height in Potting Soil (cm)	Marigold Height in Vermiculite (cm)

Look at the results of the table.	Were the plant heights always consistent (eg plant 1 was always tallest, plant 2 alwa	ys
shortest) or was there no set gr	owth pattern for the plants?	

Create a bar graph showing the height of each plant as compared to their soil.	Use the average final height of all of the
plant/soil combinations.	

Which conditions were found to be best for each of the plants? Did any particular result(s) stand out?

In what type of environment are the plants regularly found in the wild? Is this consistent with what the results in the experiment would indicate?

The Real World:

Students should be able to hypothesize why plants have certain characteristics. Some possible adaptations include the shape of the roots and leaves. Were there any adaptations present in the plants used for the experiment?

Many scientists dedicate hundreds of hours studying the optimal conditions for plant growth. How could the results of their findings affect the agriculture industry?

Today's world has many issues that are destroying habitats. Some examples include logging, urbanization, and natural disaster. How does this affect the plant habitat?

Marigolds, 2016

Grade 4 Activity Log Answer Key: Adaptive Structures of Plants

Create a bar graph showing the average height of each plant as compared to their soil. Use the average final height of all of the plant/soil combinations.

Which conditions were found to be best for each of the plants? Did any particular result(s) stand out?

The answers depend on the results of the experiment.

In what type of environment are the plants regularly found in the wild? Is this consistent with what the results in the experiment would indicate?

Students will have to do a quick background check to find out where the plants live in the wild. Students must then decide if those conditions would be similar to the soil in the experiment.

The Real World:

Students should be able to hypothesize why plants have certain characteristics. Some possible adaptations include the shape of the roots and leaves. Were there any adaptations present in the plants used for the experiment?

The roots of some differ depending on the need for water. A plant with all equal size roots requires more water than a plant with one large root and others branching off. Leaves also control the amount of sunlight the plant wants to receive, and water loss.

Many scientists dedicate hundreds of hours studying the optimal conditions for plant growth. How could the results of their findings affect the agriculture industry?

These results would allow the agriculture industry to grow crops in the best conditions possible to maximize plant yield.

Today's world has many issues that are destroying habitats. Some examples include logging, urbanization, and natural disaster. How does this affect the plant habitat?

A change in habitat conditions could allow plants with certain adaptations to start to thrive and may kill off other species present.

Grade 5 Activity

Ozone Depletion, Global Warming, and the Water Cycle

Objective:

To investigate possible effects of ozone depletion and global warming on the growth of plants. Students could also learn some of the different stages of the water cycle.

Curriculum Fit:

Science:

Movement of Air and Water

301-13 – Relate the constant circulation of water on Earth to the processes of evaporation, condensation, and precipitation

Environmental Issues

108-1 – Identify positive and negative effects of technologies that affect weather and the environment

106-4 – Describe how studies of the depletion of the ozone layer, global warming and the increase in acid rain have led to new inventions and stricter regulations on emission from cars, factories, and other polluting technologies

Materials:

- Indoor light garden
- Growing trays
- Water
- Fertilizer
- Potting soil
- Bean seeds
- Lettuce seeds
- Additional supplies that are needed but not supplied by program- watering can, popsicle sticks to mark students plants

Background Information:

Two of the largest environmental issues over the past couple of decades have been the hole in the ozone layer and subsequently global warming. The effects are being felt all over the world. At the two poles, melting ice caps have caused ocean levels to rise as well as cause a change in environment for animals living at the poles. Droughts and heat waves are being felt all over the world. In the Gulf of Mexico, warmer ocean temperatures have led to more powerful hurricanes. The effects of global warming also affect plants. Some plants are thriving in the increasing heat, whereas some plants are trying to adapt to a new environment. The experiment also mimics the three main stages of the water cycle: precipitation, evaporation, and condensation. Precipitation is mimicked by the watering of the plants, evaporation by the drying out of soil and leaves of bean plants, and condensation by the retrieval of water from a tap.

In the experiment, the rows on the light garden will have a different light height from the plants. The top row will be set 1 inch above the tallest plant, and the bottom row 3 inches above the tallest plant. The bottom row is set to the recommended height so it represents normal conditions. The top row is very close to the plants. This represents global warming conditions as the lights will make the plants warmer, and the more intense light represents a hole in the ozone layer.

Introduction:

Explain to students the following:

- 1. What the hole in the ozone layer is.
- 2. The causes of global warming.

Activity/Procedure:

1. Divide the students into groups of 3 or 4. Each group will receive two seeds.

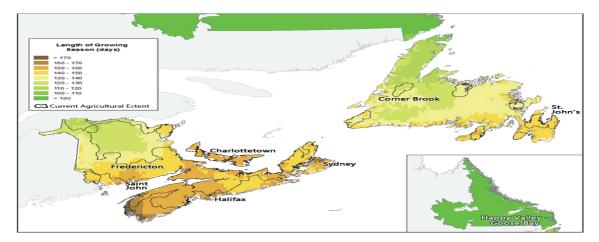

- 2. Each seed should be planted to an appropriate depth in the soil. Ensure that each seed is planted on a separate tray so they may be placed on different rows.
- 3. The trays used should be transferred to the light garden. Ensure each tray is placed on a separate row.
- 4. Adjust the heights of the light rows to the following:
 - i. The top row should be adjusted to 1 inch over the soil.
 - ii. The bottom row should be adjusted to 3 inches over the soil.
- 5. Plants should receive light on a daily basis. Lights should be left on during the entire school day for as long as possible.
- 6. Beans should be watered at least every second day. Ensure that the soil is damp, but not soaked, after being watered. Use water soluble fertilizer on a weekly basis with regular watering.
- 7. At the start of every week, the plant trays should be rotated. This is to ensure that all plants receive an equal amount of light for growth. As well, each row should be checked to see if the height of each light fixture needs to be adjusted.
- 8. Observations should be recorded every Monday, Wednesday, and Friday.
- 9. At the end of the allotted growing time, all activities in the attached activity log must be completed

Conclusion:

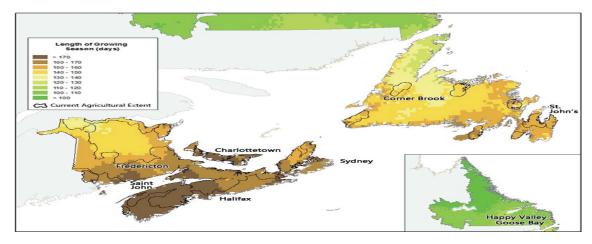

Students will have observed the effects that global warming could have on plants, specifically beans. Students also should have gained an understanding of the water cycle as it relates to plants.

In-Class Discussion:

- 1. What are some additional effects caused by global warming?
- 2. What are some ways that humans are trying to counteract the effects of global warming?

Grade 5 Activity Log Answer Key: Ozone Depletion, Global Warming, and the Water Cycle

Global Warming

Under which conditions did the bean plant best survive? Using the observations, would a bean plant be able to survive a continuous increase in global temperature?

The best survival conditions will be determined from the results of the experiment.

Do you think the results of the experiment would have been the same if a different species of plant had been used? Why or why not?

Different types of plants are best adapted to survive in different environments so the results would likely be different depending on which type of replacement plant is chosen.

How has industry changed with the discovery of global warming and the hole in the ozone layer? What new regulations have been implemented?

Many companies are trying to make more energy efficient products. Some examples of new products include hybrid cars, refrigerators, and light bulbs. New regulations include reducing greenhouse gases, pollution, ect.

Water Cycle

Define the three steps of the water cycle in your own words:

Precipitation: When water falls from the sky in the form of rain, snow, ice, or sleet

Evaporation: When water on earth changes to vapor and rises into the atmosphere

Condensation: When evaporated water changes to a liquid state

Where do these processes occur on earth? Where are they mimicked in the experiment?

Precipitation occurs from a cloud and travels to the ground. In the experiment, this occurs when the water travels from the watering cup into the soil.

Evaporation occurs on the ground and the vapor rises to the atmosphere. In the experiment, water evaporates from the soil or from the plant.

Condensation occurs in the atmosphere on earth. It does not occur exactly the same way in the experiment; however it would best be mimicked when water travels from a tap into the watering cup. The watering cup could be thought of as a cloud in this circumstance.

Great Artwork from Mrs. Lynch, West Kent Elementary, Charlottetown, 2016

Grade 6 Activity:

Applying Plant Adaptations to Understanding Data Collection

Objective: To develop science skills, and develop skills on how to record information, and how to apply it to a real world situation.

Students should also observe some of the adaptive features of plants

Curriculum Fit:

Science: Life Adaptations and Natural Selection

204-1/205-8 – Propose questions about the relationship between the structural features of organisms and their environment, and uses a variety of sources to gather information about this relationship

Mathematics: Patterns and Relations

PR1 – Demonstrating an understanding of the relationships within table of values to solve problems

PR2 - Represent and describe patterns and relationships using graphs and tables

Statistics and Probability

SP2 – Select, justify and use appropriate methods of collecting data, including: questionnaires, experiments, databases, and electronic media

SP3 - Graph and collect data and analyze the graph to solve problems

Shape and Space

SS8 - Identify and plot points in the first quadrant of a Cartesian plane using whole number ordered pairs

Materials:

- Indoor light garden
- Growing trays
- Water
- Fertilizer
- Potting soil
- Vermiculite
- Bean seeds
- Marigold seeds
- Lettuce seeds
- Graph paper
- Additional supplies that are needed but not supplied by program- watering can, popsicle sticks to mark students plants

Background Information:

Plants have a variety of adaptations that allow for them to not only survive, but to thrive in their environments. Roots, leaves, and flowers come in different shapes and sizes. Each feature is generally adapted over centuries to be as effective as possible in its natural environment.

The abilities to graph and read graphs are very important skills in the world. A handful of different jobs that require these abilities include: scientists, teachers, chemists, and business owners. Graphs provide a visual means to see and interpret data. In many cases, the information being researched would not be able to be interpreted without graphs.

Introduction:

The teacher should explain the following to students prior to the start of the experiment:

- 1. How to plot in Cartesian coordinates.
- 2. How to mark coordinate pairs on the Cartesian graph.

Activity/Procedure:

- 1. Assign students into group of four.
- 2. Each group should receive four seeds: two of each type of plant being used.
- 3. Two different types of soil should be used to grow the plants in. Fill two trays with one type of soil and fill two other trays with the other type (vermiculite).
- 4. The class should now have four different trays. Each tray represents a different seed/soil combination. Be sure to label the seed/soil combination on the side of the tray.
- 5. Each group should plant the appropriate seed in the appropriate tray. Be sure to label which slot in each tray belongs to who for identification purposes when switching the garden.
- 6. All trays should then be transferred to the light garden.
- 7. Lighting should take place every school day. Beans should be watered at least every second day. Ensure that the soil is damp, but not soaked, after being watered. Marigolds should be watered every second day, or every day if the soil is dry. Use water soluble fertilizer weekly as part of regular watering.
- 8. Plant height should be recorded every Monday, Wednesday, and Friday in the activity log. If a plant is not yet visible, a height of 0.0cm should be recorded. Plants should be measured from the soil to the highest point of the plant. During the weeks the plants are located with students in the 4th grade, the numbers for those weeks can be taken from the 4th grade students.
- 9. At the start of each week, the position of the trays should be rotated. This is to ensure all plants receive a relatively equal amount of sunlight. As well, each row should be checked to see if the height of the light fixtures needs to be adjusted.
- 10. At the end of the activity, plants should be examined. Height, quality of the plants (green or yellow in color), and if applicable, flowers are examples of what should be examined.
- 11. Activities in the Activity Log should then be completed.

Conclusion:

Students should have viewed some of the adaptive features of different plants. Students also should have learned one way in which to apply sciences skills to the real world by collecting, recording, and graphing data from an experiment.

In-Class Discussion:

- 1. Was it easier to view the data in table or graph format?
- 2. Do all the graphs for the same plant/soil combinations look similar or do they all look different? What could this mean?

Grade 6 Activity Log: Applying Plant Adaptations to Understanding Data Collection

Create a chart showing the height of each plant every Monday, Wednesday, and Friday. A height of 0.0cm should be recorded if no plant is visible.

ind then slower grow	rth, or was it a constan	t growth?			
Compare your graphs different periods of g		smates. Do they all fo	llow the same basic gro	owth pattern or did man	y have
	asis for adaptation to a adaptive features allo			st adapted to which soils	:? Can you

Grade 6 Activity Log Answer Key: Applying Plant Adaptations to Understand Data Collection

Plot the recorded heights on graph paper with a Cartesian plane format. The y axis will represent the height of the plant in centimeters. The x axis will represent how many days have elapsed since the start of the experiment. For example, if the experiment was started March 5, then the x axis value for March 8 would be 3. Don't forget to label each axis and title the chart.

The instructor will judge how well done the graph was.

Looking at your chart of recorded points and your graph, how did your plant grow? Was there one period of rapid growth and then slower growth, or was it a constant growth?

This question can be answer by looking at the graph.

Compare your graphs with some fellow classmates. Do they all follow the same basic growth pattern or did many have different periods of growth?

Answer will be formed by comparing results.

Using height as the basis for adaptation to a specific environment, which plants were best adapted to which soils? Can you hypothesize on which adaptive features allow for the adaptation?

The answer will depend on the results of the experiment.

Were there any soils in which no plants would grow? Can you think of any plants that would grow in those soils in the wild?

The answer will depend on the results of the experiment.

Grade 7 Activity

The Role of Decomposers in the Environment

Objective:

Attempt to grow plants in a variety of soil conditions (with and without decomposing material) and attempt to understand the roles of decomposers and producers in the ecosystem.

Curriculum Fit:

Science:

Components of an Ecosystem

304-2 – Identify the roles of producers, consumers, and decomposers in a local ecosystem and describe both their diversity and their interaction

210-1 – Identify organisms as producers, consumers, and decomposers

304-1 – Explain how biological classification takes into account the diversity of life on Earth, using the terms producer, consumer, and decomposer

306-2 - Describe how matter is recycled through interactions among plants, animals, fungi, and microorganisms

306-3 – Describe interactions between biotic and abiotic factors in an ecosystem

Decomposers

304-3 – Describe conditions essential to the growth and reproduction of plants and microorganisms in an ecosystem and relate these conditions to various aspects of the human food supply: air, temperature, light, and moisture

Soil

310-3 - Classify various types of soil according to their characteristics and investigate ways to enrich soils

Mathematics:

SP1 – Demonstrate an understanding of central tendency and range by: determining the measures of central tendency (mean, median, and mode) and range, and determining the most appropriate measures to report findings

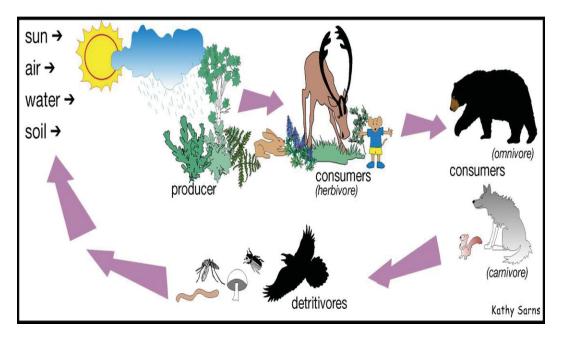

PR2 – Create a table of values from linear relation, graph the table of values, and analyze the graph to draw conclusions and solve problems

Materials:

- Indoor light garden
- Growing trays
- Water
- Fertilizer (Granular)
- Potting soil
- Bean seeds
- Marigold seeds
- Lettuce seeds
- Earth Worms (can pick up from school yard or students home)
- **Additional supplies** that are needed but not supplied by program- shredded newspaper ,granulated sugar, watering can, and popsicle sticks to mark students plants

Background Information:

Decomposers play a vital role in the recycling of matter through an ecosystem. Without decomposers, many elements would remain encrusted in the earth with no means of returning to the surface. Decomposers function by breaking down materials into a form that can be engulfed by plants (producers). Producers will use this recycled matter to help them grow, and return the matter back to the surface. A consumer will generally eat a producer and gain the recycled matter. Consumers then eat consumers until the final consumer in the food chain has passed away. The cycle then restarts.

http://huckleberryfinnclc.weebly.com/decomposers.html

Preparation:

Small strips of newspaper should be mixed into soil for plants on the bottom row. A tablespoon of sugar should be thoroughly mixed in as well.

Introduction:

Explain to students the following:

- 1. The main differences between a consumer, producer, and decomposer.
- 2. The different types of decomposers (eg worms and mushrooms).

Activities/Procedure:

- 1. Students are divided into groups of 3-5.
- 2. Each tray on the lighting system is to be labeled. One tray should say "Fertilizer", the next tray should say "soil", and the last tray should be labeled "newspaper/sugar". These will be the three different soil compositions for the experiment.
- 3. Each group must plant one seed in each of the three conditions. One tray should contain granular fertilizer mixed into the soil, the second tray should have just soil, and the third tray should have strips of newspaper and one tablespoon of sugar mixed into the soil. Students must plant each seed to an appropriate depth. Students should try to have a few Earthworms in the tray with the newspaper and sugar.

- 4. Plants should receive light on a daily basis. Beans should be water at least every second day. Ensure that the soil is damp, but not soaked, after being watered. Marigolds should be watered every second day, or every day if the soil is dry.
- 5. Plant height measurement should occur every Monday, Wednesday, and Friday. If no plant is visible, a height of 0.0cm should be recorded. The measurement should occur from the soil to the highest point on the plant.
- 6. At the start of each week, the position of the plant trays needs to be rotated. This is to ensure all plants receive equal amounts of light intensity. As well, each row should be checked to see if the height of the light fixtures needs to be adjusted.
- 7. At the end of the experiment, one final height measurement should be taken.
- 8. All activities in the Activity Log should be completed after the experiment.

Conclusion:

Students should be able to see how important decomposing materials, and thus decomposers, are to the environment.

In-Class Discussion:

- 1. Comparing the effects of sugar and newspaper to the soil with Fertilizer, was there any difference in the quality of the plants?
- 2. Comparing the plain soil to the soils with added matter, was there any noticeable differences in the plants?
- 3. Most Fertilizer is broken down by decomposers to be used by plants. What would happen if there were no decomposers on earth?

Grade 7 Activity Log Answer Key: The Role of Decomposers in the Environment

What is the effect of adding fertilizer on the growth of the plants?

This should allow for better growth than in the row with no added materials. The experiment should confirm this

Sugar is essential for growth. How did the plants grown with added sugar grow compared with the plants with fertilizer?

This question can be answered with the results of the experiment.

Define a decomposer, consumer, and producer. How do these three things interact?

Consumer: A consumer eats living things to obtain energy.

Decomposer: A decomposer breaks down dead organisms to obtain energy.

Producer: A producer has the ability to create their own energy.

These interact by recycling matter in the environment. Decomposers break down dead consumers and producers into a form that can be absorbed by some producers. This keeps matter in the ecosystem.

What conditions enhanced plant growth? What conditions did not enhance plant growth? Hypothesize some ideas as to what makes these conditions different.

The effects of the different conditions can be found from the experimental results. The hypothesis should mention the difference in matter present.

Classify the different types of soils according to their characteristics (eg texture).

Answers will vary.

Find the mean final height value for each plant and soil combination in the classroom (can be completed with in-class discussion at the end). Were all plants relatively similar in average size or did the extra matter create a difference?

Answers will depend on the results of the experiment.

Grade 8 Activity

A Practical Use for Light Reflection

Objective: To understand the light patterns of the light garden, as well as to compare ratios and rates of growth of different plants.

Curriculum Fit:

Science: Reflection

308-09 – Describe the laws of reflection of visible light and their application in everyday life: regular versus diffuse reflection, angle of incidence = angle of reflection

208-7 – Formulate operational definitions for incidence, reflection, and the normal

209-2 - Estimate angles of incidence and reflection

210-14 - Identify and correct practical problems in the way a constructed optical device functions

Electromagnetic Radiation

109-13 – Explain the importance of using the words frequency and wavelength correctly

113-2 - Describe possible negative and positive effects of technologies associated with electromagnetic radiation

Mathematics: Patterns and Relations

PR1 - Graph and analyze two-variable linear relations

Number

N3 – Demonstrate an understanding of percents greater than or equal to 0%

N4 - Demonstrate an understanding of ratio and rate

N5 – Solve problems that involve rates, ratios, and proportional reasoning

Shape and Space

SS3 – Determine the surface area of a right cylinder to solve problems

Materials:

- Indoor light garden
- Peat Pots
- Seed Tray
- Water
- Fertilizer
- Potting soil
- Bean seeds
- Lettuce seeds
- Additional supplies that are needed but not supplied by program- watering can, popsicle sticks to mark students plants

Background Information:

Light is essential for life on earth to exist. Without light, plants would not be able to grow, and food would run out. Light obeys many physics laws. One set of laws deals with reflecting light off of a surface. There are three main definitions of light reflection that are vital to understanding how it works: the normal, angle of incidence, and angle of reflection. The normal is an imaginary line drawn perpendicular to the

surface at which reflection occurs. It intersects the surface precisely at the point where light hits the surface. The angle of incidence and the angle of reflection are very similar.

Light is an example of electromagnetic radiation. This means that it is composed of an electrical and magnetic wave. Electromagnetic waves are extremely important in today's society. Cell phones, x-rays, and the radio are just a few examples of technology that uses electromagnetic waves.

Introduction:

Explain to students the following:

- 1. How light reflects off a surface.
- 2. How light refracts when changing mediums.
- 3. How to compare rates, ratios, and percentages.

Activity/Procedure:

- 1. Students are to be placed in groups of at least two.
- 2. Each student should be assigned one seed and one cup. Students should fill their cup with potting soil and bury their seed to an appropriate depth.
- 3. Partners will bury their seeds in different trays. This ensures that one seed for each group will be in different lighting
- 4. Have one tray of plants located at the middle of the light garden row, and have one tray located at the very end of the row. These tray positions are not to have their positions changed at any point during the experiment.
- 5. The plants should receive light on a daily basis. Lights should be left on during the entire school day for as long as possible.
- 6. Beans should be water at least every second day. Ensure that the soil is damp, but not soaked, after being watered. Use water soluble fertilizer on a weekly basis as part of regular watering.
- 7. Height measurements should be taken on the first day of every week to allow for a comparison of growth rate. The heights of both plants should be recorded. As well, the height of each light fixture should be checked to see if an adjustment is needed.
- 8. One final height measurement should be taken at the end of the activity.
- 9. After the activity, all activities in the Activity Log should be completed.

Conclusion:

Students should understand the light reflection patterns of the Light Garden. Students should also have learned how to compare rates and ratios by comparing the two different trays.

In-Class Discussion:

- 1. The light garden says that plants that are left at the center of the tray generally will grow faster than those left on the end due to a higher light intensity. Was this observed in the experiment? Why is the light more intense at the middle than at the ends of the tray?
- 2. Share with the class your ideas on the best design for light reflection. Which design seemed most efficient and why?

Grade 8 Activity Log: A Practical Use for Light Reflection

Grade 8 Activity Log Answer Key: A Practical Use for Light Reflection

Were the two ratios fairly similar or different? What does this mean?

The closer that the ratios are to each other, then the more similar the growth rate of the plants were. A large separation between ratios indicates that one rate was much faster than another.

Try to calculate the surface area of each plant stem. Since the plant will likely be skinnier at the top and thicker at the bottom, choose a circumference from the middle of the plant to use in the calculations. Compare the two as a ratio. Was this ratio similar to the other two?

The answer will be the circumference at the middle of the stem multiplied by the plant height. The similarity in ratios is dependant on the experiment.

Properties of Light:

Describe the following terms:

Angle of Incidence: The angle at which light approaches a point, measured from the normal to the path of light.

Angle of Reflection: The angle at which light leaves a point, measured from the normal to the path of light.

Normal: An imaginary line perpendicular to the point where light is travelling to/through. It separates the angle of incidence and the angle of reflection.

What is the difference between the frequency and wavelength of light? How are they related?

The wavelength is how long one single unit of light is. The frequency is how often the wavelength repeats itself. They are related because frequency multiplied by wavelength equals the speed of light.

Light is an electromagnetic wave. What are positive and negative effects of technology that is associated with electromagnetic waves?

There are many sources of both positive and negative effects of technology using electromagnetic waves. For example, cell phones, x-rays, and the radio all use electromagnetic waves to function. A downside is overexposure to electromagnetic waves may cause illness.

Do you think that the angles of the mirrors are at an appropriate position? Could you suggest any additional changes that would reflect more light onto the plants?

This is an opinion based question.
